

F4SCS Digital Signage System

FACTION FOUR
SYSTEMS INC.

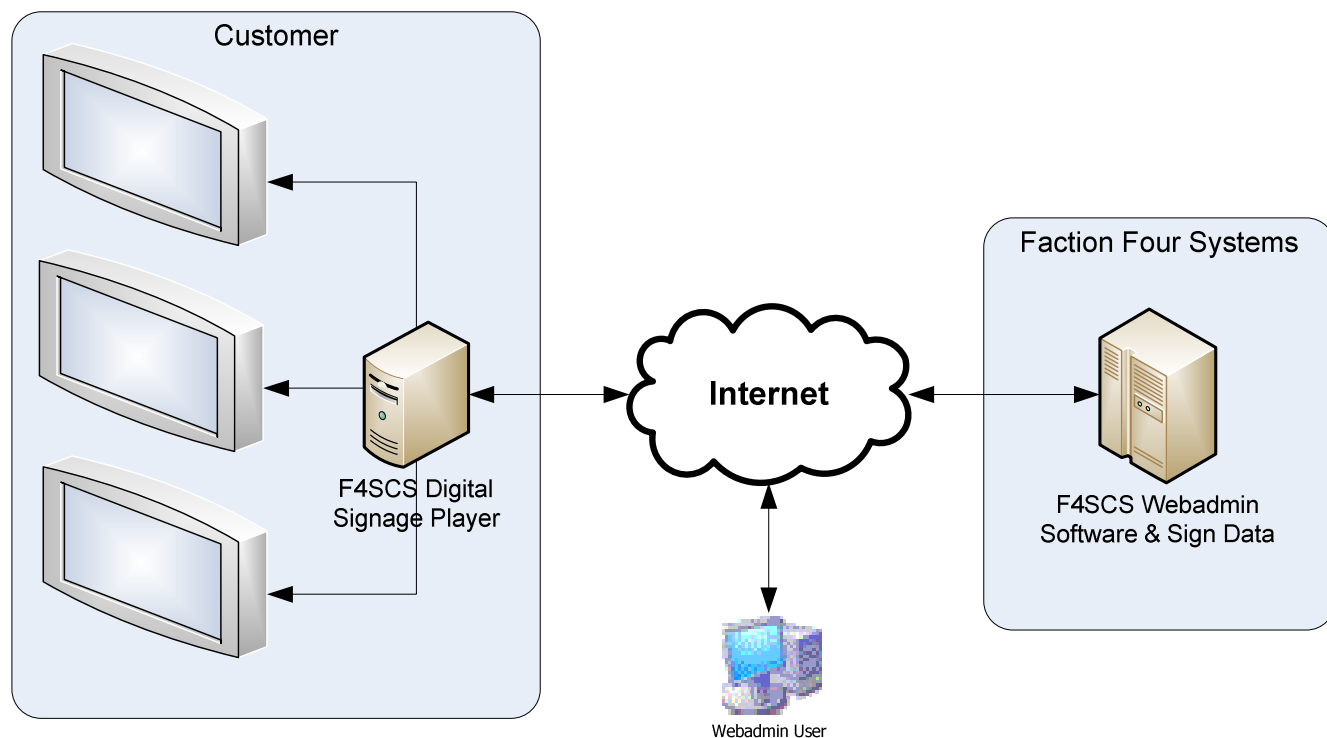

System Overview

Sports facilities, arenas, stadiums, fitness clubs and conference centers all have guests that need up to the minute information. The F4SCS platform for digital signage provides information to your customers before, during and after the game or event.

The F4SCS administration tool allows users to log in from any computer on the internet to update their sign's data, and the sign software reloads any updated content on a specified interval, making it a simple turnkey solution for sign users and viewers.

System Design

With the architecture of the system, the customer needs to have a computer connected to the internet, and at least one screen to display the signage content. The system depends on an internet connection as all the sign layout and data are stored on secure servers managed by Faction Four Systems. As we have already invested into the infrastructure to provide reliable delivery of content to your sign – so you wouldn't have to. The F4SCS Digital signage suite allows you to concentrate on your core business and not worry about the back end.

What We Deliver

Software

The F4SCS system includes a set of prebuilt “core” modules out of the box; however custom modules can be easily created and plugged in without visiting your sign.

Included Core Modules

- Scheduler – Manage a schedule for a specific person or location. This allows administrators to use an easy to use calendaring interface to enter events, and have it display through the F4SCS digital signs in an easy to read fashion.
- Advertisements – Display an assortment of images specific to sponsors or other organization. Easy management of images allows administrators to dynamically change the advertisements on the fly.
- Messages – Display announcements or other messages through this feature. It allows an administrator to enter announcements in a simple to use tool that functions like a word processor, and have it formatted properly on your digital sign.
- Security – Control who has access to edit your sign content, specific to the data. For example, you can have one user that is able to manage messages, but not advertisements.

Software Maintenance

F4SCS Support specialists will intervene when necessary to correct any software malfunction. As the F4SCS system pulls its sign content and data from the internet, there is no requirement for most updates to the software. We will ensure that you continue to receive new software features and enhancements when they are made available.

System Implementation

Software install

We can integrate into most existing hardware or recommend the appropriate setup for your digital sign or kiosk. We will install the software and get your sign up and running properly.

User interface design

We work with your organization to determine how your sign should look for your needs. We build a custom interface that will show up on your digital sign.

Training guide

We will supply users of the system with a training guide that they can use to master the use of the F4SCS system.

System Requirements

F4SCS Schedule Player

- A 450 MHz Pentium 2 (or equivalent) computer with 128mb of ram is required.
- Supported Operating Systems are:
 - Windows 98
 - Windows ME
 - Windows 2000
 - Windows XP
 - Windows 2003 Server
 - Windows Vista
- 15 MB of free hard drive space
- A full time high speed internet connection

F4SCS WebAdmin Client

- Internet Explorer 5 or Firefox 2
- An internet connection
